Target weighting changes the interpretation of covariance contributions
A Between-target C_B range
Median range = 0.3052
Model configurations (N = 109)
Range of C_B across 5 weighting schemes
B Within-target C_W range
Median range = 0.1240
Model configurations (N = 109)
Range of C_W across 5 weighting schemes
C Directional stability across weighting schemes
C_B (between-target)
C_W (within-target)
Configurations reversing sign
40/109
5/109
36/109
5/109
4/109
C_W: 5/109 reverse sign
C_B: 34/109 even at $|C_B| > 0.005$
$|C| > 0$ (No threshold)
$|C| > 0.001$ (Near-zero filter)
$|C| > 0.005$ (Moderate filter)
